

New beginnings – Mission RED PLANET

The year is 2032. You and your team have just been appointed as the senior management team to head the mission of a US Tech Billionaire that have decided to colonise Mars. He has just been appointed the President of the United States in a highly controversial election and therefore will not be going along on the mission

You will be leading a group of a 1 000 people to colonise and establish a new civilisation on the red planet. The problem is that once there, all contact with earth will be severed and you will not be able to secure supplies from earth, nor will you be able to share technology. Everything you need to set up the new civilisation will have to be taken along on the original mission.

You know nothing about the people that you will be responsible for in the new civilisation. You only know that they were the chosen few aged between 14 and 40 but as far as you can determine no allowance was made for quotas on gender, nationality, race, ethnicity, culture or religion among the chosen group. You will have to be ready for every eventuality in the new (largely hostile) environment.

You already have the basics set up to create a similar climate within an enclosed atmosphere similar to that of earth. This environment created will only provide yourself with sufficient resources to sustain your fellow settlers with 6 months without any potential shortages of resources. After that you will have to resort in cases to your locally provided resources in some instances. The estimated ABSOLUTE limits to the means of survival on Mars is 2 years.

There is also no formal governance structure to guarantee a coordinated provision of resources to survive beyond the first two years.
